## Dashboard mapping question for DEMO

Hi -

I need an example of what I need to "map" to have a common dashboard defined so it will visible/usable in multiple namespaces.

I have created a dashboard in "SAMPLES" (namespace and database) and I would like to have this dashboard be accessible/useable from a 2nd namespace, but I'm not having any success in doing mappings (global/package/routine/data) to be able to get DeepSee to be able to see/display the dashboard.

What is the minimum that I need to map?

[#Databases](#) [#Namespace](#) [#InterSystems IRIS BI \(DeepSee\)](#) [#Dashboards](#) [#Mapping](#)
