# CacheBlocksExplorer

Database Blocks Explorer for InterSystems Caché

## Key features

### Tree explorer

- Shows tree of database blocks;
- Export tree as SVG or PNG image;
- Shows every node in the block;
- Open any block just by clicking on node in parent block;
- Reload block info by clicking at the same node second time;
- Zoom in and out, fit and navigator;
- Easy way to switch between view modes (tree/map);

### Fragmentation map

- Shows every block with the same colour for every globals;
- Legend for globals;

## Installation

Minimal supported version is 2015.3 or 2016.1.

Just import xml file, in any of your namespaces by Studio or in any other way, with compilation, user should have an access for creating web applications. And then you can open that application by link

<http://localhost:57772/blocks/> (just check your host and port).

Last releases you can find [here](#) on github.

And on github available standalone installer, which create namespace named BLOCKS with the same name database, and web application "/blocks/".
