## Zen Mojo - Disable button on JQM Plugin

Hi All,

I am trying to disable a button on a JQM application.

I started the button as disabled according to this code: `{type:'$button',caption: Button',key:'button',disabled:true}`

However, I would like to enable or disable the button via JavaScript code . I have tried the following, but it don't have the same behavior and style as the code above.

```
var view = zen('mainView');  
view.disableItem('button',true,0);
```

I expect to get the same component behavior of `{type:'$button',caption:'Standard Button',key:'button',disabled:true}` when enabling or disabling the button through JavaScript code. I mean, the same style, color, behavior, etc.

I have also attached a basic test that I have done.

Can anybody help me please?

Thanks.
