SELECTING distinct keys from a collection

Is there a way to select distinct keys from an field that has a collection index? I have a field defined as follows:
Property data As %Library.String(COLLATION = "EXACT", MAXLEN = "", TRUNCATE = 0); Index data On data(KEYS) [Type = bitmap]; And I define a build value array method that parses my data outputs an array in the format array(KEYS)=VALUES. This is very useful because I can query my data using criteria such as WHERE FOR SOME %ELEMENT(data) (%KEY='param') My question is whether there is some way to select distinct key values, e.g. SELECT DISTINCT KEYS FROM _ . Should I come up with a better way to project this property as table perhaps, may using a computed field? Thanks!
