How to increase the timeout for ZEN refreshContents()?

When refreshing a html or tablePane component using refreshContents() that takes a lot of server-side-processing, I'm running into timeouts every now and then. i.e., the result for the tablePane is that there's nothing displayed at all.

How can we configure (relax) that timeout so also those heavier ones get refreshed eventually? Just overriding %requestTimeout in %OnPreHTTP did not seem to do the trick.
