Best way to retrieve specific record?

New to CSP and Zen. I've been going through tutorials and have made some progress. Using the "Contacts" tutorial as an example, I'm trying to create a "ViewContact" page. I want this to be linkable so I'm using [URI Parameters](#), which I understand. However, what I'm not sure about is how to retrieve a specific record. Should I use a SQL statement? If so, how?

Let's say I just wanted to display the property "Name" for the contact with ID 12. What would be the best way to do so?
