Announcing Support for Docker Container Technology as a Platform in 2016.1 Release

InterSystems is delighted to announce the support of Docker container technology as a platform from the moment 2016.1 will be released.

Docker is a disruptive system technology that has many benefits and offers many advantages for those investing in infrastructure-as-code or immutable-infrastructure provisioning & deployment scenarios.

Like any new technology that appears, there is a learning curve, and many considerations need to occur when using it. However, Docker container technology has already proven to be successful by a huge follow-up with many companies already using it in production. Furthermore & FYI, all public cloud providers already support it.

InterSystems validates and supports its technologies on Docker container engine from v1.8 and above with CentOS, Ubuntu, RedHat and SUSE based containers from the official Docker Hub repository or their respective projects and sites.

Have fun with it
