Healthshare/Ensemble/Cache deployment tool? Anyone every created one?

I'm working on a proposal for a deployment tool development project and I was wondering if anyone had any experience with such a thing.

We use Healthshare and implementations for new clients are tedius and lengthy. Lots of ensemble service, registry value, lookup tables, namespaces and other things have to be created and configured.

I would like to create a Zen or CSP page based deployment tool that can do all this with a few parameters and some custom code.

Has anyone done this? What are some pitfalls you ran into? Any unique ideas you included? Other general thoughts?
