Atelier and complicated projects

Most of projects on Caché, obviously, written not only in Cache ObjectScript, and should contain sources in other languages. Such as js or css for web-projects or any others. And it would be pretty good, if I could see all of files in one project, and possible to edit all of them. How to be in this case ?

And I think it is not a good idea, to place all project's sources in one root folder. Our project contains over 3 thousands classes and routines, and it is too difficult to find anything in such folder. Is not a good for it to use Java-way, and place every package in subfolder ?
