Help with SQL error

Error:

[SQLCODE: <-400>:<Fatal error occurred>]
[Cache Error: <<SUBSCRIPT>%0AmEdun+4^%sqlcq.HSREGISTRY.cls966.1 ^¦¦%sql.temp(1,"")>]
[Location: <ServerLoop - Query Fetch>]
[%msg: <Unexpected error occurred: <SUBSCRIPT>%0AmEdun+4^%sqlcq.HSREGISTRY.cls966.1
^¦¦%sql.temp(1,"")>]

Here is an example of a query that gives the error:

SELECT COUNT(DISTINCT Criteria) as Relevance FROM HSIHEATNARepository.Aggregation
WHERE EventType = 'CROSS GATEWAY QUERY'

The content of the actual field is XML, but the query simply returns a number. Here is one that works:

SELECT COUNT(DISTINCT DestinationURI) FROM HSIHEATNARepository.Aggregation
WHERE EventType = 'CROSS GATEWAY QUERY'

The result here is "8"

Anyone have any ideas?
