How to Properly setting up CSP-Application (Security)?

Hi,

posted some weeks ago in the "old" ZEN Google Group, maybe someone here can help to understand how to properly setting up a csp applications and contributing from the build-in caché security mechanism.

I´ve created a webapplication and wan´t to add further security to it using the smp. But... first things first.

I have two Databases let´s say DB1-LOGIN and DB2-Application. Each of this DBs has a resource assigned. DB1-LOGIN has a resource %DB1-LOGIN which has a public permission of 'read'. DB2 has a resource as well %DB2-Application with no public access.

I have defined two roles webapp-admin and webapp-user. Only webapp-admin and webapp-user are allowed to access DB2-Application. I´ve created to test users. test-admin (which has the webapp-admin assigned) and webapp-user (no special roles assigned). The CSP-Application in the smp has application role webapp-user. So test-user is automatically a webapp-user. So far so good.

Q1 - Must the defined ressources are also need to be added to the csp-application roles tab?

Q2 - How to set the required resource to run the csp-application (general tab - but listbox does not show any of my defined resources)?

Q3 - How to assign the resource to the roles webapp-admin and webapp-user?

Q4 - Securing Access to pages - ZEN-Page Class Parameter RESOURCE how to define under the given circumstances. I have pages which shall only be accessed by a webapp-admin. So I guess the parameter look like RESOURCE = "webapp-admin:U". But how to define this "use" - flag?

Best regards,

Sebastian
