Better Unit Testing Strategies for InterSystems Caché Development

Good morning people.
The use of TDD is currently being reference for software delivery more confiabilitade and quality.

At the company I work developing web applications , we create tests for method class in a deteminado package and running the steps that the documentation recommends:

1 export the tests classes to a predefined folder.
2- And running the test (D ## class (% UnitTest.Manager) .RunTest (,"/nodelete")

It is a lot of work to do the export and run these tests would have a resource that we could only run the tests without the need for export?
