No Namespaces found

Hello!

I'm trying to use iKnow but I get the following error "No iKnow-enabled namespaces found" in the Management Portal.

It was working on the 2015.2.2 version but now on 2016.2.0 it doesn't. I very new to Caché and iKnow so it's probably a simple problem.

I was able to create a iKnow domain using the terminal and I can view it in the learning portal (http://localhost:57772/csp/sys/exp/iKnow.Ul.IndexingResults.zen_).

What can I do to make it work in Atelier? I've tried authenticating with SYS:SYS and USER:USER but neither seem to have any namespaces.

Very thankful for any help!

The screenshot shows a Windows-style dialog box titled "New Atelier Project". Below the title bar, the main heading is "Create a New Project". A red error icon is followed by the message "No namespaces reported by selected server". The dialog contains several input fields: "Project name:" with the value "Demo", a checked checkbox for "Use default location", and a "Location:" field with the path "C:\Users\Benjamin\InterSystems\Atelier\workspace\Demo" and a "Browse..." button. Under the "Connection Configuration" section, there is a "Server:" dropdown menu set to "Myconnection" and a "Namespace:" dropdown menu which is empty. A blue link "Configure server..." is positioned to the right of the "Server:" dropdown. At the bottom left is a help icon (question mark in a circle), and at the bottom right are "Finish" and "Cancel" buttons.
