Global Summit 2016 - What Hyper-converged Hardware Means for You

Presenter: Mark Bolinsky

Task: Decide whether a converged infrastructure is ideal for your enterprise applications

Approach: Discuss best practices and provide guidance on the right questions to ask

The traditional use of "SAN storage" is no longer the only choice for deploying enterprise application. Software defined data centers are making inroads into enterprise data centers, and there is good reason for it. There is the potential for significant infrastructure cost savings, architecture simplification, reduced administration costs, and depending on the configuration - even better performance. This session will discuss some best practices and outline decision guidance to help you ask the right questions when considering hyper-converged architectures.
