Global Summit 2016 - Many Data Sources, One Application

Presenter: Mark Massias
Guest Speaker: Bruce Porteous of Northgate
Task: Build a composite application that bridges data silos
Approach: Give a real-world example of combining data from multiple sources to run a composite application

Most organizations need to bridge silos of data or combine separate applications. This session describes techniques for building composite applications and silos. The session also looks at a real application that does this. It uses workflow to assign cases to individuals for investigation and extracts information from multiple systems to provide the investigator with a complete context for the case at the scene of the incident.

Content related to this session, including slides, video and additional learning content can be found [here](#).
