Starting a Routine from the Windows command prompt using ccontrol

Greetings.

I'm currently struggling with launching a routine from the command prompt using ccontrol.

Basically I have a routine with a parameter which works fine using the following:

```
ccontrol cterminal ^ANDYTST("/c: %temp%\\") USER
```

This receives c: %temp% / then in the routine.

However, when there is a space inside the parameter it assumes that it receives a script.

I can still run it using ccontrol terminal, but that then tells me the argument is invalid.

Therefore, is there something like a placeholder for whitespaces?

And, is it possible to hand it the credentials?

Or is there a better way to launch a routine from an external script?

I could do it via a TcpClient and telnet but that's a bit clumsy and I'd prefer not to go down that route.

Thanks in advance

Andy
