Bootstrap - load body content dynamically with fixed menu

Hello, one of our application partner, is considering modernizing their old CSP laboratory portal by using Zen Mojo with Bootstrap. They have a lot of experience with COS, CSP and some ZEN. They are new to REST/JSON and have some limited knowledge of javascript - perhaps not enough to the extent used by client framework.

They are trying to create their portal main page with header and footer fixed where at the header level is going to have a menu or navbar and at the footer level they would like to have some options (buttons, search options, text, messages, etc) dynamically loaded during run time.

At the body level they would like to load the layout page according to the menu header option once selected. They would like not to repeat the header and footer code on all the template classes. They are really interested in to know whether is it possible or not to have the header/footer as components?

Thanks.
