End-users maintaining Ensemble Data Lookup Tables

We are currently looking into a way to provide a group of end-users (i.e. non-Interface Development engineers) access to a pre-defined group of Ensemble-based Data Lookup Tables for purposes of viewing and editing. We do not want to give them access to ALL Data Lookup Tables due to security/continuity concerns.

My thinking is that a simple persistent Cache table with three columns (Role Name, Table Name, Access-Level [like View or Edit]) with a CSP front-end could potentially provide an easy way to make this solution a reality.

I heard some discussion at the Conference last week that a code sample may already be available to give us a jump start in this direction but I have not been successful in locating one. Is anyone anywhere of such a sample or perhaps has delved into this themselves that might be willing to share a little context in how it could be accomplished? I am relatively new to Cache/Object Script/CSP development but eager to get my feet wet.

Thanks in advance -

Craig
