Ensemble Business Service with direct Web Service implementation

It looks like the normal usage of calling an Ensemble based Web Service via Ensemble is to create an Ensemble Business service that inherits from `EnsLib.SOAP.Service` which is then used to call a business operation which inherits from `EnsLib.SOAP.Operation` and the SOAP Outbound Adapter which can be generated via the SOAP wizard.

But, what if you don't want the extra step of calling the web service class via the operation? Has anyone actually constructed the Business Service to directly invoke the web service class? I know you lose the ability to trace any messages in this case but I'm wondering if there is a performance optimization doing this.

If anyone has done this and has a simple sample that would also be appreciated.
