## Syntax for calling label when using extended routine reference

I get NOROUTINE when I try to call a label in a routine in another namespace:

```
d someLabel^| " OTHERNAMESPACE " |someRoutine(inputVar,.resultByReference)
```

Two questions:

1. What is wrong with my syntax for calling a label in the other routine, versus just the root of the .int/mac?
2. Can I pass a parameter by reference when using extended routine reference?
