Router custom message base on List property using Business Rules

Hello,

I am trying to router a custom message using the content of one of its property, but this property is a List. ¿How I can do it?

The rule could be something like this

```
<rule name="">
  <constraint name="msgClass" value="Test.TestMessage"></constraint>
  <when condition="Document.myList.GetAt(1).property1='AA'">
    <send transform="" target="DummyOperation"></send>
    <return></return>
  </when>
</rule>
```

But this rule doesn't compile.

TestClass is a simple Request Class like this:

```
Class Test.TestMessage Extends Ens.Request
{
Property myList As %ListOfObjects;
}
```

¿Any help?
