JSON Representation of a global structure

Hi:

I'm looking for some help with JSON notation for a global structure. I need a way to represent a global structure in JSON where the global structure both has a value at a given node as well as sub-nodes. For example.

```
^Person=1
```

```
^Person(1)="Smith,John^M^1968-01-12"
```

```
^Person(1,"Address")="123 Main Street^Some City^CA^92627"
```

How would one go about representing this structure as JSON?

Thanks
