%SYS.Journal.FileSearch() - how does it accept parameters?

I am trying to execute a system query. - %SYS.Journal.FileSearch()

The Query is looking for a Journal File Name and a String.

However, the Query line accepts no parameters. - Query Search() As %Query(ROWSPEC = "Offset:%Integer")

But in the SearchExecute method if checks for File and String.

```
ClassMethod SearchExecute(ByRef qHandle As %Binary, String As %String, FileName As %String . . .
{
        i $g(String)="" q $$$ERROR($$$JournalFileSearchUndefined)
        i $g(FileName)="" q $$$ERROR($$$JournalFileUndefined)
```

Can anyone help me understand how the String and FileName is passed into the query?
