How to attach a studio debugger to a Zen class running on Ensemble server (via IIS)

Hi all - I'm running a Zen page that inherits from %Zen.Component.page, and I'd like to step through code and debug it. Is this possible, and how?

I've tried to attach to a process that I think is mine (it has my internal IP address) but is using "Unknown User". Any ideas on where to start debugging the page -- this page calls lots of other pages. I'd thought I'd start at the home page.

Perhaps I need to navigate to my page that I want to debug, and attach at that point.

Any info on the debugger in this atypical use is appreciated.

Thank you,

Laura
