Return to most recent results page after viewing post

I've been exploring the Developer Community and noticed a bug.

Steps to reproduce:

1. Load home page at <https://community.intersystems.com/>
2. Scroll to the bottom and select a different page (e.g., 2)
3. Select a post
4. Go back with the browser
5. You should see the same page of results, but I'm seeing the first page regardless of which page I was on previously.

I think one way to address this is to change the URL when the user clicks a different page -- e.g., change it to

#page2. Then this is part of their browser history. When they go back, they can

hit <https://community.intersystems.com/#page2>, and the client-side JS can load the appropriate page.

I'm sure there are other ways to solve it but I wanted to at least note this usability issue. The Developer Community has a great interface, though!
