Atelier - newbie troubles

I have just imported our Ensemble project (not a really big one, like two man-years) into my MacBook Air Ensemble 2016.3 instance to test many things (document model, etc.), Atelier among the others.

The "Production view" is not here, and I miss it.

The opening of Diagram Editor for BP is pretty hidden. I would even like having a switch, which would default to the Diagram Editor.

Anytime I click on the Open Diagram Editor, it waits for a while, ten produces an error and only then I can see the diagram.

The error says: Your Studio browser is no longer valid... etc.

I cannot find an easy access to the Save or Compile command, once I do some changes in the respective BP via the Diagram Editor.

Compiling larger amount of classes produces an error:

No conflicting files to resolve.

Compile failed: Gateway Timeout

Compiling identical set of classes "per partes" goes well, however.

Sooo, does anybody have some hints or comments to the issues?

Thx

Michal

PS: I am total ignorant concerning Eclipse. Saying that I ask you for patience when explaining the Eclipse stuff.
