Call/execute *.exe on windows from objectscript

Hello,

we build a COS-application which includes classmethods for running a simulation calculation (differential equations by Runge Kutta procedure) which runs well but needs too much time. This is embeded in Cache Server Pages and we tried already to start the simulation as a JOB to avoid the CSP-timeout. However the Job needs of course also too much time. May be this could be solved by a different strategy to run the simulation calculation by an external Windows -Programm (developed with Delphi). Original the application for simulation was developed in Delphi, where it needs a significant shorter time than in the COS-application.

Our question is how can we start and execute the windows-programm from a Cache Server Page?

Any hint is welcome?

Lutz.
