Credentials in Ensemble - working in other namespaces

Hello community,

I have productions running in several different namespaces. They all use a common credentials ID for sending email, which is set up in only one of the namespaces. The documentation says that credentials are entered by namespace. When I ran a production in a second namespace, the error log said that credentials were not found (expected), but later attempts to send a file thorugh the production did successfully send an email. I'm wondering if Ensemble is able to look in other namespaces for the same credentials ID?

I just want to make sure, since I'm moving this to a live system. I'd prefer not to duplicate the credentials ID, anyway.

Thanks,

Laura
