Git Continuous Integration - What are the most important differences between CacheGitHubCI and CacheUpdater?

Hi!

I am about to configure a server with continuous integration for a client. I found that our Russian friends have again come up to the rescue and developed not one, but two continuous integration tools for Git and Caché:

- <https://github.com/intersystems-ru/CacheGitHubCI>
- <https://github.com/intersystems-ru/CacheUpdater>

My question is simple: What are the most important differences between the two and which one is going forward so I can choose the right one?

Kind regards,

Amir Samary
