Inheriteing a zen page from another custom zen page -- best practices

Hello,

Has anyone encountered or done this: inherit a zen page from another custom zen page?

e.g. EditPage extends %ZEN.Component page

///base code, some abstract methods

Property id;

UserEditPage extends EditPage

//user edit code

Property id As %String [ZENURL = "ID];

I'd like to take advantage of the inheritance and put all the common methods in the parent page EditPage, but there's no %OnNew concept for the zen page, so I can't set properties for each child page when first creating it.

Perhaps %OnBeforeCreatePage? %OnAfterCreatePage? I don't see any examples of extending a custom page in the SAMPLES namespace.

Thanks,

Laura

What are the best practices for inheriting a page
