Ensemble + .Net dll with MS Word

Hi,

We have created a dll with .Net that generates a MS Word document with a template. The .Net method works, we have tested it with Visual Studio and it generates the document.

But once we have created the dll and embebed it in Ensemble through the Wizard, when we try to execute the method that generates the document, it doesn't work. It doesn't throw us an error, it simply doesn't open the template.

We have seen that MS Word program is opened, but that's all.

We are using Microsoft.Office.Interop to generate the Word document. It must be Word 97 version document.

What are we missing? Are we doing something wrong?

Thanks
