Simple Arithmetics

Can somebody explain this behaviour of Cache (and many other calculating machine as well) :

WRITE 1/3*12

4

WRITE 1/3*5

1.666666666666666667

W 1/3*18

5.999999999999999999

W 1/3*21

6.999999999999999999

W 1/3*24

7.999999999999999999

How can we make more accurate calculations in Cache ?
