How to force HTTP status response using EnsLib.REST.Service

Hi everybody,

I created my own REST service class by extending EnsLib.REST.Service.

In some particular conditions of the parameters of the request, the REST service should respond to the client with an HTTP status response code 400 "Bad request".

I read the article "RESTful Exception Handling" and I try to use the suggested:

do ..ReportHttpStatusCode(400)

But the server seems ignore it and get back to client the 500 http response code.

Any suggestions?

I am sorry if the question is a too low knowledge level but I am pretty newbie to Intersystems world.

Alberto
