## Vote here - Should Portal's schema editors respect source control?

For those who don't have a chance to vote elsewhere today, or for those who want to vote more than once

here's a poll for Ensemble users. Do you use source control to manage your development and deployment process? If so, does it concern you that Portal's schema editors, for example the HL7 schema editor, do not respect the source control class of the namespace where they file updates to a schema? By contrast, editing a schema in Studio gives you the benefits and protection of whatever source control you have set up.

We at George James Software have a particular interest in this, given that many Ensemble sites use our [Deltanji](#) (formerly VC/m) source control product. For a number of years now we have been urging InterSystems to handle source control adequately in Portal, but the schema editors are still uncorrected in the 2017.1 Field Test. So if you would like to add your vote to getting this fixed please click the green "thumbs up" at the bottom of this post.
