## Problem in Telnet

Hello folks,

We have recently upgraded the cache (5.x) to cache 2016. All are working perfectly. But i am struggling in Telnet.

Working Good,

when i connect to telnet it automatically gets the username(for example when we give the system ip addr(148.168.2.50), the ip address is taken as username) and directly goto the Password field in Telnet on old cache (5.x).

Now my problem is,

I can't get the same from my new upgrade instance 2016. When i connect to telnet it directly goes to username field but not to password field.

What is the problem ?

Anyone knows please suggest your answers . It would be helpful for us.

Thanks,

Manoj J
