What is the best method for copying Mappings and Routines?

Currently, we have an application running in one namespace ("*Database B*") that has globals and routines mapped to another database ("*Database A*"). After enforcing clean up on *Database A*, we found that 90% of the disk is free. We would like to compact *Database A* and release the unused space. However, we are running OpenVMS, which seems to be the issue.

For databases consisting of only globals, we are able to use ^GBLOCKCOPY; however, we need to ensure that the routines and mappings are also copied.

What would be the best recommended way to do this?
