Using LDAP to Authenticate and Authorize

Hi Group, I've followed the instructions from the documentation to configure LDAP and Ensemble to authenticate, however, I'm unable to authenticate using an account in the LDAP. The user is able to authenticate in a Linux shell. I have added the ObjectClass of IntersystemsAccount and the 3 group definitions to the schema. Other than adding the user to this group, do I have to change the user's objectClass at all?

This is not on active directory - it is a Linux based LDAP solution (slapd).
