## CSP Page show content dinamically

I want do to a "simple thing". Show a dynamic log of actions in the browser as we can see on Terminal. For that, I guess to make a simple CSP Page that show a new line every WRITE command is the thing I need.

But how I refresh after each WRITE?

How I can refresh the content automatically?

I made a simple CSP Page and in method OnPage I do this test:

```
write "Start..",!  
for i=1:1:10{  
  hang 1  
  write "Doing "i!"  
}
```

Don't work... because the browser show me only after the process finish.

I guess I should use another way... any help?
