<FORM> <OnLoadForm> multiple parameters

Using a <FORM>

The OnLoadForm attribute calls a method but doesnt allow definition...

It seems to send pKey and accepts back pValues

```
Method LoadForm(pKey As %String,
                ByRef pValues As %String) As %Status
```

Is there any way to send more than just pKey as I need multiple values when loading the form.
