## Issue with perl and caché

Hello community,

I'm triing to use perl with Caché on CentOS 7.

- Caché is installed and working
- Reading doc for perl module
- Adding path of Caché/bin in PATH and LD\_LIBRARY\_PATH as suggested in doc
- Creating mMakefile (perl Makefile.PL)
- Success at compilation (make)
- Fail at test (make test). And return the following message:

Can't load 'blib/arch/auto/Intersys/PERLBIND/PERLBIND.so' for module Intersys::PERLBIND: libcbind.so: cannot open shared object file: No such file or directory at /usr/lib64/perl5/DynaLoader.pm line 190.  
at test.pl line 10.

The test are a simple file that try to load the module in perl and connect to Caché.

But it doesn't pass the module importation.

After digging a little, when loading the module compiled (PERLBIND.so) crash. Perl return that after the return of the library. No because he can't get it.

The used version is cache-2016.2.1.803.0-Inxrhx64.tar.gz.

Any information or track about that are welcome.

Regards.
