Local instance caché 2016 messed up; server availability error

Hi all, This is a bit embarrassing, and not that critical. I have a local instance of Caché 2016 on my computer, for playing around with. I was attempting to set up two-factor authentication on this instance, and I *thought* I simply disabled all users except for my own user and enabled two-factor for this user. The next time I tried to login to the Management portal, I received a Server Availability Error:

http://localhost:57772/csp/sys/UtilHome.csp

Caché Server Pages Version 2016.1.1.107.0

Server Availability Error

Server is currently unavailable

I can login to the terminal successfully, and was playing around with the ^SECURITY settings, but I am not able to find what I did and fix it. Any suggestions?

Of course the last resort is to uninstall and reinstall, but that will just be a pain. I'd rather learn by trial/fire/whatever.

Thanks,

Laura
