How to run csession command without having to supply user credentials?

Hi,

I am trying the following command in order to freeze the instance before backup is done:

```
csession CACHE -U%SYS "##Class(Backup.General).ExternalFreeze()"
```

The command requires user name and password to be supplied when prompted. Is there any way that this command can be run where it doesn't query the credentials? I am wondering if it can use OS level permissions (root or effective user who owns Cache processes etc) .

My test is on a CentOS 6 machine if that helps.

Thanks,

Raghu
