Is there any way of paginate SQL Query in Caché?

Hi,

My doubt is about the **SQL Query in Caché**:

I don't want to take all results from the table and organize them manually, for example: I have a table with 50 records, but I only want to select **10** records, being **from tenth until the twentieth** and this without knowing their IDs.

So, how can I do this, without losing performance, there is any way?

NOTE: In other SQL languages I can do, for example, `SELECT * FROM extbl Limit 10 OFFSET 10`

Thanks,

Andrei L. Nenevê
