## Help creating Web Methods for a SOAP HL7 Receiver

I am configuring a SOAP HL7 Receiver to handle HL7 Query messages.

I have set up a new class based on `EnsLib.SOAP.Service` and configured (correctly I hope) the parameters needed. I have also amended the `OnProcessInput` Method skeleton provide to send messages on to the Business Process needed.

I am struggling to work out what is needed in the Web Methods and how to create them.

Any help with this would be much appreciated especially examples that I can adapt for what I need.

Many thanks
