Generating JSON message with attributes containing odd characters

I have a `Enslib.REST.operation` which I want to use to send a JSON message. In Ensemble I am using the request message to the Business operation as an input for `ObjectToJsonStream` function so I can send it out (this is the way to go right?). However, I am now running into the fact that one of the attributes (`templatename`) contains an underscore and that I am not allowed to use the underscore to define the property in my ensemble `RequestMessage`:

`Property templatename As %String;`

What's the best way to resolve this?
