Can you create ad-hoc Caché relationship objects?

Can you create ad-hoc Caché relationship objects that are not part of the original Caché class definition? One of the drawbacks with relationships is that that the more relationships you have defined, the more difficult it can be manage. I was wondering rather than having all your relationships defined in the Caché class, could you programmatically create relationships between classes as and when they are required? We mostly use parent-child relationships in our classes. It is not uncommon for us to have 4 parent-child relationships defined in a single class and each of those children have relationships with other classes. Any thoughts?
