ErrJobRegistryNotClean

Hi,

We have an HTTP business operation where the messages gets stuck and we had to recycle the operation to resume the processing. We are trying to work around this (for time being until we find the root cause) using below code which should recycle the component.

```
Set tSC = ##class(Ens.Director).EnableConfigItem(pConfigItemName,0,1)
Set tSC = ##class(Ens.Director).EnableConfigItem(pConfigItemName,1,1)
```

However, it did not make any difference. When we manually recycle the operation, it prompts for the force update and we have to force it down. So I tried including `Set tSC=##class(Ens.Job).Stop(pjobID,30,1)` after the call to disable the operation.

```
Set tSC = ##class(Ens.Director).EnableConfigItem(pConfigItemName,0,1)
```

```
Set tSC=##class(Ens.Job).Stop(pjobID,30,1)
```

```
Set tSC = ##class(Ens.Director).EnableConfigItem(pConfigItemName,1,1)
```

That gave ERROR <Ens>ErrJobRegistryNotClean: Job registration global for job error.

Appreciate any assistance.

Thanks

Ramesh
