Eclipse SQL Client Plug-In for Caché?

Atelier Users:

Has anyone found an Eclipse plug-in that provides the capability to connect to a Caché server and give the user a way to write SQL queries using the tables from that server? I'm picturing something like a "WinSQL"-client built as an Eclipse plugin.

I've found and tried the following, but I couldn't get it to connect to my local Caché instance.

http://eclipsesql.sourceforge.net/

I do a lot of SQL query building with the SQL tool on the Management Portal or $system.SQL.Shell() from terminal before moving the queries into my COS code. A plugin that lets me do that building right from the Eclipse workbench would be handy.

Thank you,

Jean
