Experience and advice using Veeam with Caché

I am looking for experience of people running Veeam with Caché databases.

Tips/Tricks/General questions like; what Veeam features are you using, what your backup cycle looks like, where does your data end up, what recovery/integrity checks you do, what sort of compression/dedupe you get.

Also what questions you have and what problems you might be trying to solve.

[#Caché](#) [#Backup](#)
