Atelier and Inspector

Hi,

Cache Studio's inspector window can show me a Cache class's properties, methods parameters, XDATA blocks, Triggers, Foreign Keys, Queries and more, in a table in the Inspector window. Additionally, for properties, where the property accepts parameters, these parameters are listed together with possible value choices.

If my class is a subclass, then, the Inspector can show me the effective list of properties, methods, parameters etc, which I can use as a result of inheritance.

I find this extremely useful, and particularly beneficial to users starting to use Cache for the first time; when you have a semi-complicated object data model; or, you are starting to inherit from system classes you don't normally use and are not immediately familiar with.

Is there an Atelier equivalent and if not, (but is on the roadmap), when we could expect this ?

Thanks - Steve
